

## StemGuard ADO Touch-Free Door Operation

Automatic touchless door operators for  
new and existing communal doors

Studies show that 80% of infectious diseases are spread by touch, and that infection can last on hard surfaces for several days. As a result there are a number of anticipated changes around the use of commercial and educational buildings, and how occupiers can be protected.

Recent reports suggest that Automatic Doors should be used wherever possible, and this is particularly important in common areas such as receptions, lift lobbies and toilets. Stemko Group have packaged some solutions for the automation of internal doors, which will allow for touch-free automation of your existing doors, reducing the possibility of cross contamination from door handles and push plates. This is particularly relevant for toilet entry and exit doors.

### ✓ User Confidence

Peace of mind for users no longer having to touch handle after washing their hands

### ✓ Touch Free

Touch-free sensors and controls, even for locking versions

### ✓ Retrospective Installation

Installed on your existing doors
